

TOTAL SOLUTIONS

Vomerica and its vendor partners have the ability to design and deploy a 4G broadband network that suits the specific demands of each location. 4G Improves upon 3G services in that it offers even greater speeds to upload and download data.

4G service is now here. 4G allows for greater up and download speeds (at maximum rates, from 100 down to 50mbps up), which means your mobile device or laptop can handle multiple programs at faster speeds. Imagine downloading an application, talking on the phone, and watching CNN simultaneously!

But what makes Vomerica unique, is that because of our experience and very tight relationships with our vendors, we can deploy LTE or Wi Max more cost effectively and efficiently than our competitors.

We can deploy LTE (Long Term Evolution) through Ericsson. LTE runs on the 700mhz to up to 1.2ghz spectrum. We deploy Wi Max through Cisco. Wi Max uses microwave technology and runs on the 2.5 to 3.6 ghz spectrum. That's why we say we can design and deploy based on specific needs and spectrum availability. Both offer unparalleled speed and performance. The differences are primarily in the spectrum used and in the compatibility of mobile devices. Both have plenty of mobile choices to choose from, although Wi Max has computer chip maker Intel in its corner. To learn more about each go to www.lteforum2010.com and www.wimaxforum.org.

In addition to wireless broadband networks, we offer a Total Solutions package to suit your needs. We can design and deploy an entirely new International Gateway for you to manage call traffic better, ensuring proper governmental revenue, and 100% accurate billing information.

In this process, we also can install Plain Telephone systems (PSTN), fiber optics for increased clarity and bandwidth, and install our very own VoIP software which will greatly reduce telephone rates into and out of the country. Our business class VoIP network can allow you to make as many calls as you desire, even from office to office all over the world, by just pushing a few digits as if the office is in the next cubicle over. We even do Internet Video Conferencing, with unsurpassed rates.

Our team of Systems Engineers can design and deploy any type of communications infrastructure you need. We will consult with you on each project layout and design for YOUR needs. As an added bonus, we also have in-house our own servers and web design and services team. You will realize maximum savings for web hosting and support.

Vomerica can handle all of your telecommunications and IT needs end to end!
